INTRODUCTION

Televisions used to be the basic staple in households. Now it's nothing more than affixture occupying space. Watching TV has become too mainstream. We have to pay for a whole batch of channels and what we get in return is repeat episodes, stale content and annoying commercials in between. It is expected that 34.9 million. American households will cancel their cable services by 2023. This could be a potential reason why the term "cord-cutter" is doing rounds in the television industry. Netflix clone apps are on the rise. During the lockdown, the demand for content is insatiable. Before coronavirus took grip over the country, binge-watching in your comfy pajamas was a weekend thing. But now with the advent of various digital platforms, binge-watching is the new normal. In fact, many of you might be nearing the end of your streaming queue. It's the right time for you to take your video streaming business to next level by getting the best Netflix clone app.to know more about live video streaming app development. Undoubtedly video live streaming apps have disrupted the television industry. So, let's take a deep dive into the ecosystem of video live streaming apps i.e., Netflix Clone apps. If you don't want your content to get lost in the noise then push notifications may be the marketing strategy you need to try. In real-time, you can reach your audience in an effectual way and it's a great way to retain them. According to research, the app users who received push notifications were much more likely to keep using an app when subscribed to push notifications than those who were not.

STREAMZ App is a social video streaming website very similar to Netflix on which people can watch the videos, share videos, like/dislike and comment on the videos etc. In order to gain an overview about the report, firstly, the purpose and scope of this document will be given, and the overall description of STREAMZ system is followed. In addition to these, system feature such as uploading video, watching video, sharing video, subscribe etc.

It is basically an android app which is used for video streaming and much more. This app is based on Netflix and clone its features. A person using this app have a thrilling experience as it gives an immense pleasure to the users in this app, we have features of authentication recommendations and much more.

If we want to fully understand the impact of video streaming in society and the entertainment industry we must first look at the technological advancements that paved the road so companies and serve

The focus of this project is on Netflix clone effectiveness. If we want to fully understand the impact of video streaming in society and the entertainment industry, we must first look at the technological advancements that paved the road so companies and services like Netflix could become successful.

Streamz is an on-demand video streaming platform similar to Netflix.

RATIONALE:

Online streaming is one of the fastest growing industries. In fact, the video streaming market is worth more than 30 billion dollars. It's expected to be worth more than 70 billion dollars by 2021.

More importantly, video streaming is outgrowing video on demand. The year over year growth of live video is 113%, while long videos on demand have grown 30% and short formats have grown only 9%.

Custom OTT services offer many advantages for companies that want to capitalize on the latest viewership trends, ensure deeper engagement, and improve customer satisfaction.

The major advantages are:

The biggest advantage offered by OTT is better control of companies over content distribution. From quality and content type to audience, monetization, user experience, and data, companies have the flexibility to streamline each aspect as per their customers' needs. Further, OTT services can reach out directly to their target audience and develop a communication channel to receive user reviews, feedback, and ratings. This provides OTT companies with access to a large amount of user data, which they can use to offer personalized services and promotions. Cloud-based OTT solutions enable the scaling up of operations quickly across multiple geographies. Besides, OTT platforms offer service providers the flexibility of choosing a monetization model depending on their users' requirements.

OBJECTIVES:

OTT platforms serve users with quality content. OTT provides users with numerous options to watch the content of their preference. Some of the key objectives of OTT are as follows:

1. Commercial-free or ad-free TV viewing experience
2. Unlimited entertainment
3. Broadcasting live content
4. Creating recommendation system according to the user's interests.
5. Easy and secure access to platform content.
6. The content can be streamed on multiple devices with screens, such as Smart TVs, computers, laptops, mobile phones, tablets, gaming consoles, and so on.

Feasibility Study:

If talking about the feasibility of this project, the project is very feasible in terms of technicality and economy.

Technical Feasibility:

STREAMZ is a complete android-based application. The main technologies and tools that are associated with STREAMZ are

- Dart
- Flutter
- Google Firebase
- Figma
- Adobe Illustrator
- Android Studio

Each of the technologies are freely available and the technical skills required are manageable. The application will be hosted in a free hosting space, but for later implementations (if required) it can be hosted in a paid hosting space like Google Play Store or Apple Appstore. Bandwidth

required in this application is high, since it does incorporate multimedia aspects. From these it's clear that the project STREAMZ is technically feasible.

Economic Feasibility:

With the availability of dirt-cheap data, and the COVID-17 pandemic confining people inside their homes, more and more people have been turning to streaming services for their entertainment needs. For a streaming service, the project requires minimal investment as infrastructure needs are eliminated through cloud processing, and so on.

With such a low investment venture, this project is estimated to show exponential growth due to the explosion of internet and the confinement of people into their homes. Most people might also be attracted towards our project/service, because of the reduction of hassle of managing different subscriptions into one, and bringing the trending content from all the leading streaming services into one, thus leading into finding the content faster than ever.

Social Feasibility:

The project has some legal technicalities into the licensing domain, as most of the content on our platform revolves around licensing it from other platforms, however, the legal technicalities only involve contract negotiation and procurement of content, which should be an easy task for

an team of experienced legal personnel. Thus, from a legal perspective the project only demands the presence of a competent legal team, which is always required a investor of the project anyways. Hence the project also become legally feasible.

Risk Feasibility:

The project has minimal risk factor due the low cost of investment and it exhibits higher chance of success due to the presence of larger user base in the domain of streaming services. This project exhibits a high chance of high Return on investment (ROI) due to the recent internet boom in our nation and the presence of a growing demand of entertainment content. Hence, it should be easier to classify this project as low-risk venture, as the pros of this project, far outweigh the cons of the same.

METHODOLOGY:

I have built this project using the following tools & techniques:

- Flutter
- Firebase
- Machine Learning Algorithms
- VS Code
- Operating System: Windows 10, 11

- Memory: 4 and 8 GB of RAM

To be able to use this Flutter app locally in a development environment you will need the following:

1. We will need a VS Code installed on the computer.
2. We will need to create an account on firebase and you should create a project on your firebase account dedicated to this STREAMZ project.
3. We will need the file to seed our firebase backend with movies information.

Facilities Required:

The minimum requirement of this system is 2 GB RAM ,8 core GPU, 50 GB ROM, and android operating system.

Expected Outcome:

This is a clone of Netflix website built using Flutter as a Front-end & Firebase as Back-end. It's not a replica, and it doesn't have all the features of Netflix website. It's a similar version of Netflix with our own design touch, showing our abilities in Flutter to build something advanced like Netflix. It contains the home page, sign-in page, sign-up page, browse page, and movie player.

Netflix has a unique way of presenting its content to their audience. There are four things that set Netflix apart from most streaming services. It collects data on audience watching behaviors, has a global market, orders most content by seasons and for its income relies on paid-subscriptions. These are the elements that influence the content Netflix makes and deliver a unique viewing experience. Another element discussed at length in this thesis is the environment Netflix produces its content for.

STREAMZ is good with all the excellent and overwhelming apps because it prioritizes the needs of subscribers. Regular transformation is bringing innovations and making all its subscribers more comfortable. That makes clients glued to this platform.
